**DEADLY HAZARDS:**

**VOLCANOES**

The red triangles show where active volcanoes are located. Volcanoes are often found along the boundary between two tectonic plates.

# VOLCANOES

Some volcanoes are high mountains....  
....others are just vents in the ground.

boston.com

Some volcanic eruptions are effusive (gentle)....  
....others are explosive. These eruption columns can  
be over 30 km high.

Mary Jo Penkala/Solent News & Photo Agency

**VOLCANOES**

Many volcanoes are close to towns and cities. Scientists monitor these volcanoes carefully to try and keep people safe.

**VOLCANOES**

Science Photo Library

Lava flows are quite slow, but they destroy buildings, crops, and roads.

USGS

**VOLCANOES**

Guardian.co.uk

Volcanoes can produce huge volumes of ash. Ash kills plant life, makes driving very dangerous, and damages jet engines. Ash looks like dust, but it's very heavy – it made this aeroplane tip over.

jalopnik.com

popsci.com

National Geographic

**VOLCANOES**

Lahars (sometimes called mudflows) happen when volcanic ash mixes with water. They travel many miles from the volcano, and can bury entire towns in minutes.

Pyroclastic flows are the deadliest volcanic hazard. Scorching clouds of gas, ash, and rocks race along the ground at up to 100 km per hour, burning everything in their path.

# VOLCANOES

Volcanoes emit toxic gases, including sulfur, fluorine, and chlorine. These gases often form acid clouds or acid rain, making the air dangerous to breathe, destroying plant life, and even corroding metal.

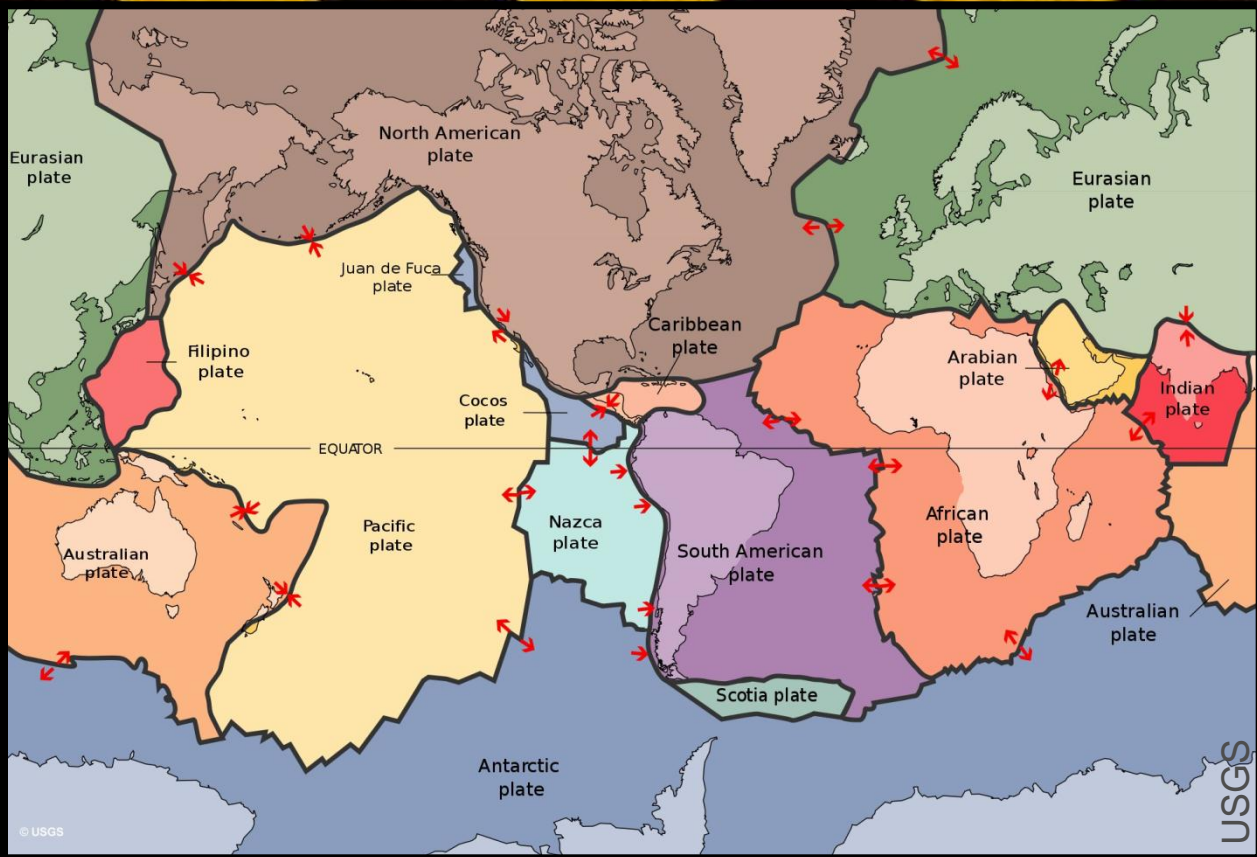

**VOLCANOES**

# DISASTER ZONE

**DEADLY HAZARDS:**

**EARTHQUAKES**

Earth's crust is made up of moving pieces called tectonic plates. Earthquakes happen along faults at the edges of these plates.

# EARTHQUAKES

abcnews.go.com

Earthquakes can open large cracks in the ground.

USGS

**EARTHQUAKES**

These fences have been pulled apart by two tectonic plates moving in different directions.

**EARTHQUAKES**

kimedia.wordpress.com

Many buildings collapse during earthquakes.

foxnews.com

**EARTHQUAKES**

Earthquake-proof buildings are designed not to collapse. This technology can save many lives – but earthquake-proof buildings are expensive.

  
**EARTHQUAKES**

There are many earthquake-proof buildings in Japan and California, where earthquakes are common.

# EARTHQUAKES

Most old buildings are not earthquake-proof, but this building in Turkey has survived earthquakes for 1500 years!

**EARTHQUAKES**

# DISASTER ZONE

**DEADLY HAZARDS:**

**HURRICANES**

Very large tropical storms only happen in some parts of the world, and they always move in the same direction.

In the Atlantic, they are called hurricanes; in the Pacific, they are called typhoons; in the Indian Ocean, they are called tropical cyclones.

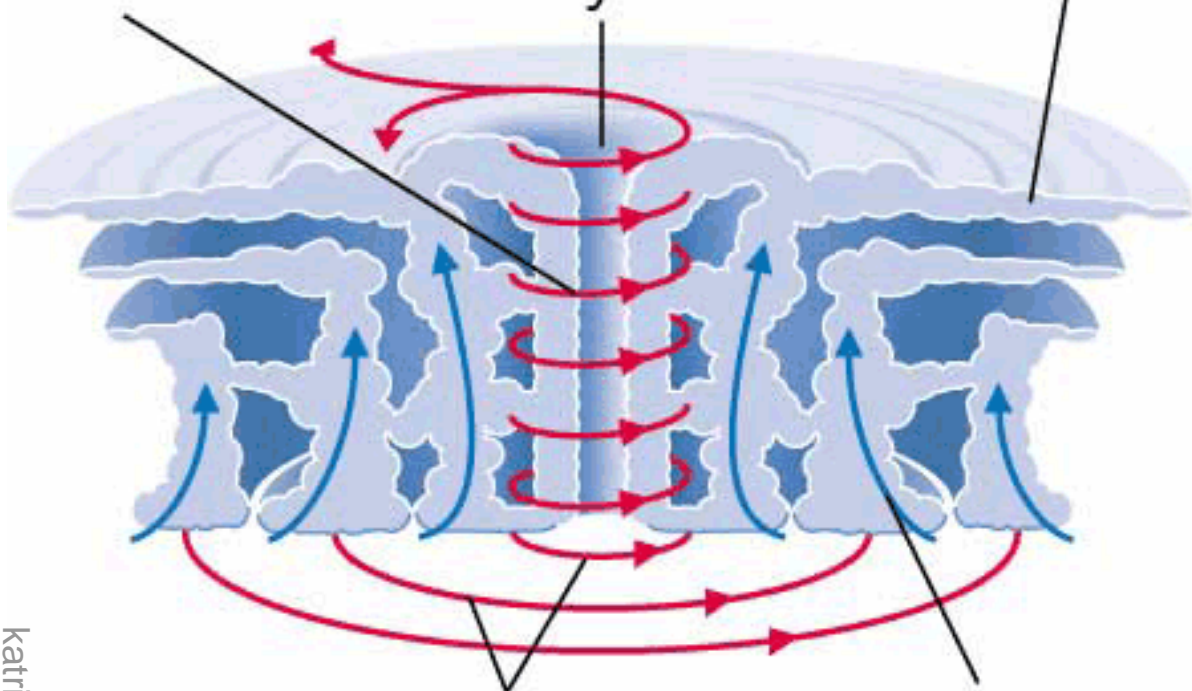

**HURRICANES**

hurricane winds  
and rain

warm  
moist air

katrinahelp.com

Hurricanes are giant, spinning storms. They start as small storms, but grow until they are hundreds of miles wide.

Hurricanes start over the warm tropical sea, and travel toward land.

**HURRICANES**

NOAA

Hurricanes are so big, they are easy to see from space.

**HURRICANES**

Hurricanes are so powerful they push the seawater up onto the land. This is called a storm surge. It is the most dangerous hurricane hazard.

Tropical storms become hurricanes when their wind speed reaches 74 mph. The strongest hurricane winds are over 155 mph.

**HURRICANES**

Hurricane winds and storm surges are very destructive.

**HURRICANES**

Hurricane Katrina hit the US in 2005, destroying special dams, called levees.

The flood waters covered 80% of the city of New Orleans.

**TSUNAMIS**

On Boxing Day 2004, an earthquake triggered a tsunami which killed over 200,000 people in 13 countries around the Indian Ocean.

**TSUNAMIS**

mirror.co.uk

There are early-warning systems to let people know when tsunami waves are coming. But if the tsunami begins very close to land, there isn't time to sound the alarm. This is what happened in Japan in 2011.

# DISASTER ZONE

**DEADLY HAZARDS:**

**WILDFIRES**

Some wildfires are started by lightning, but many are started by people, either by accident or on purpose.

**WILDFIRES**

serc.carleton.edu

After a long dry spell, grass, bushes, and trees burn very easily.

National Geographic

**WILDFIRES**

metro.co.uk

Strong, dry winds can help wildfires move extremely fast.

oregonlive.com

**WILDFIRES**

Wildfires are very difficult to control – they often destroy houses.

**WILDFIRES**

Fighting wildfires can be very dangerous.

Aeroplanes and helicopters are sometimes used to drop water and chemicals on the fires from above.

flightglobal.com

**WILDFIRES**

Where wildfires are likely, lookout towers are often used. Park rangers or volunteers watch for smoke – if the fire is caught early, it might be easier to put out.

**DEADLY HAZARDS:**

**TORNADOES**

Tornadoes form when the cloud base of giant, organized thunderstorms lowers toward the ground.

**TORNADOES**

mmembersschools.org

Tornadoes are spinning columns of air lowered from the cloud to the ground. Many tornadoes can form from one stormcell.

  
**TORNADOES**

Tornadoes don't last long – usually just a few minutes.

**TORNADOES**

usatoday.com

usatoday.com

The winds in a tornado can be over 250 mph. Some tornadoes stay over the same patch of ground – others move forward at up to 70 mph.

Matt Crowther

**TORNADOES**

Tornadoes are most common in the US, but there are be over 100 small tornadoes in Britain every year!

**TORNADOES**

NOAA

Where tornadoes are common, scientists watch storm clouds carefully. If they think tornadoes are going to form, they sound alarms so people can take shelter.

NOAA

**DEADLY HAZARDS:**

**LIGHTNING**

Thunderclouds have electrically charged layers. Lightning happens when electrical charge is exchanged – between cloud layers or between clouds and the ground.

**LIGHTNING**

Lightning can be over 27,000°C – that's 5 times hotter than the surface of the sun!

wikipedia.org

cosmosmagazine.com

**LIGHTNING**

Lightning  
can travel at  
140,000  
miles per  
hour!

NOAA

**LIGHTNING**

NOAA

Every year, the Earth experiences an average of 25 million lightning strikes.

That's more than a hundred lightning bolts every second.

**LIGHTNING**

NOAA

Lightning is attracted to objects that are higher than their surroundings, like trees, skyscrapers, and even umbrellas and golf clubs.

Lightning often strikes the same place again and again.
