

Comparison of some volcano infrasounds

Jeffrey Johnson

Volcano Acoustics Workshop

IAVCEI Kagoshima 2013

Which volcano is "loudest"?

Santiaguito (Guatemala) - pyroclastic-laden eruptions with buoyant plumes to ~1.2 km

Tungurahua (Ecuador) - short-duration Vulcanian explosions reaching ~2 km

Fuego (Guatemala) - short-duration Strombolian/Vulcanian explosions

Kilauea (Hawaii) - open-vent lava lake degassing and rock fall-induced explosions

Reventador (Ecuador) - continuous degassing giving rise to ~500-m-high plume

Villarrica (Chile) - open-vent activity from roiling lava lake

Which volcano is "loudest"?

Santiaguito (Guatemala) - pyroclastic-laden eruptions with buoyant plumes to ~1.2 km

Tungurahua (Ecuador) - short-duration Vulcanian explosions reaching ~2 km

Fuego (Guatemala) - short-duration Strombolian/Vulcanian explosions

Kilauea (Hawaii) - open-vent lava lake degassing and rock fall-induced explosions

Reventador (Ecuador) - continuous degassing giving rise to ~500-m-high plume

Villarrica (Chile) - open-vent activity from roiling lava lake

Quantifying infrasound amplitudes/energy: (Note: metrics only appropriate for monopole!!!)

Reduced pressure (monopole):

$$p_r = \delta p(t) \times \frac{r}{r_r}$$

δp = recorded excess pressure

r = source-receiver distance

r_r = reduced distance (typical 1 or 1000 m)

By power (monopole):

$$P(t) = \Omega \frac{\overline{\delta p^2(t+r/c)}}{\rho c}$$

ρc = acoustic impedance

(density x sound speed = $\sim 380 \text{ m kg s}^{-1}$ at STP)

Ω = solid angle area

($2\pi r^2$ commonly used for assumed halfspace)

Sound pressure level:

$$SPL = 20 \times \log \left(\frac{\overline{p_r}}{2 \times 10^{-5} \text{ Pa}} \right)$$

$\overline{p_r}$ = root mean squared pressure

p_0 = reference pressure ($2 \times 10^{-5} \text{ Pa}$)

By energy:

$$E_A = \int_{t_1}^{t_2} P(t) dt$$

Which volcano is "loudest"?

Santiaguito (Guatemala)

Tungurahua (Ecuador)

Fuego (Guatemala)

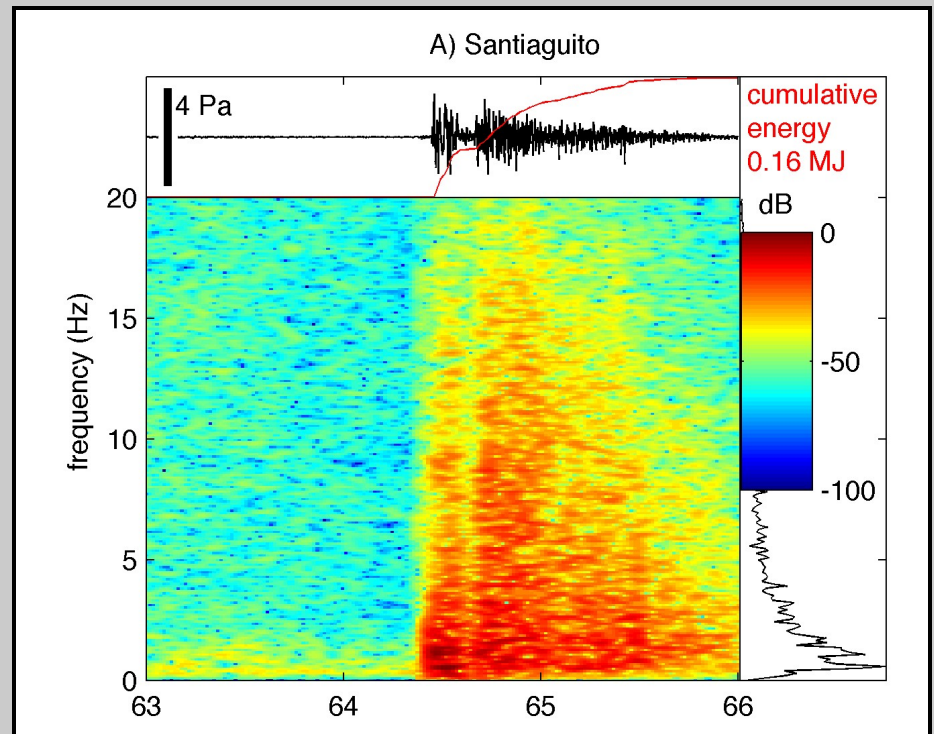

Kilauea (Hawaii)

Reventador (Ecuador)

Villarrica (Chile)

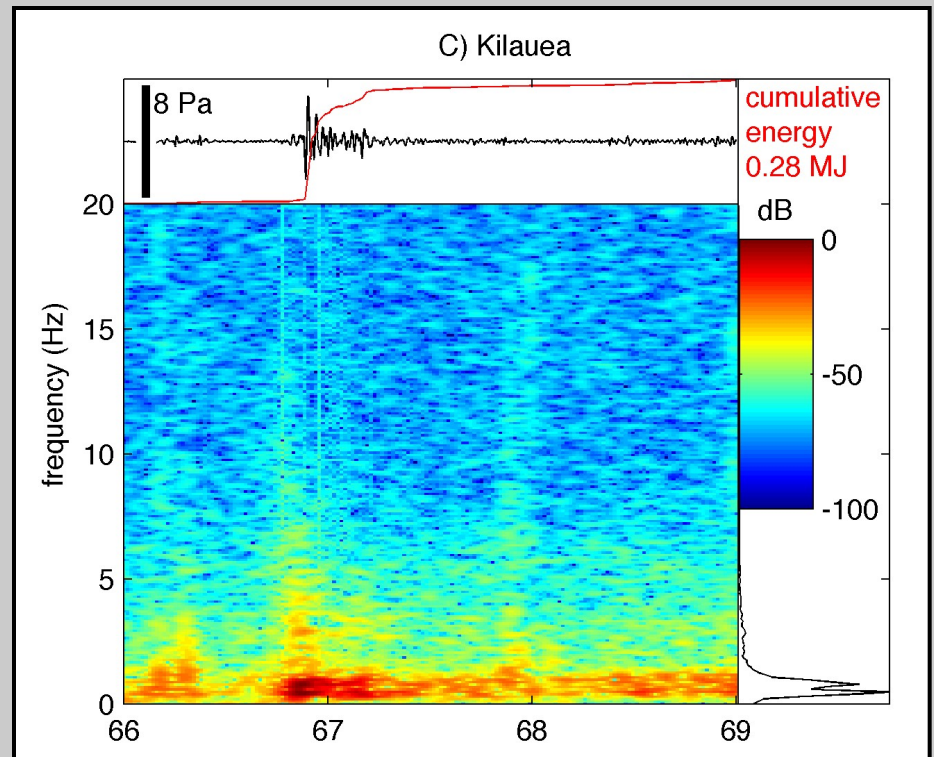

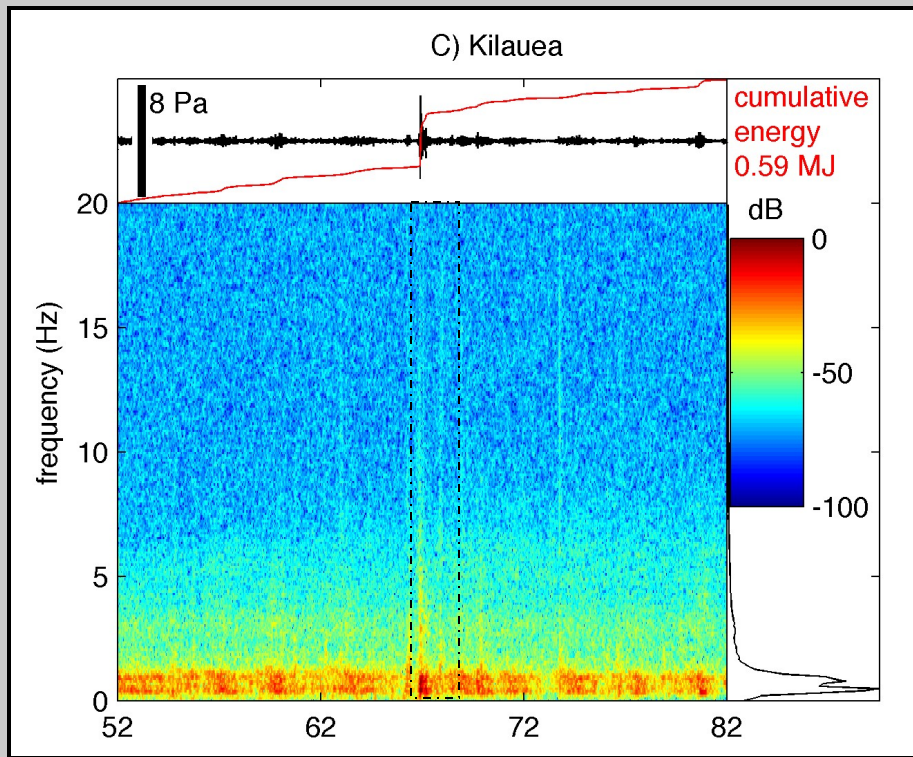

Santiaguito (Guatemala) -
 pyroclastic-laden eruptions with
 buoyant plumes up to ~1.2 km. Only
 about **100 Watts** of acoustic power is
 associated with time averaged
 Santiaguito eruptive behavior and is
 dominated by explosive events. Up to
 3000 Watts is generated during
 eruption.

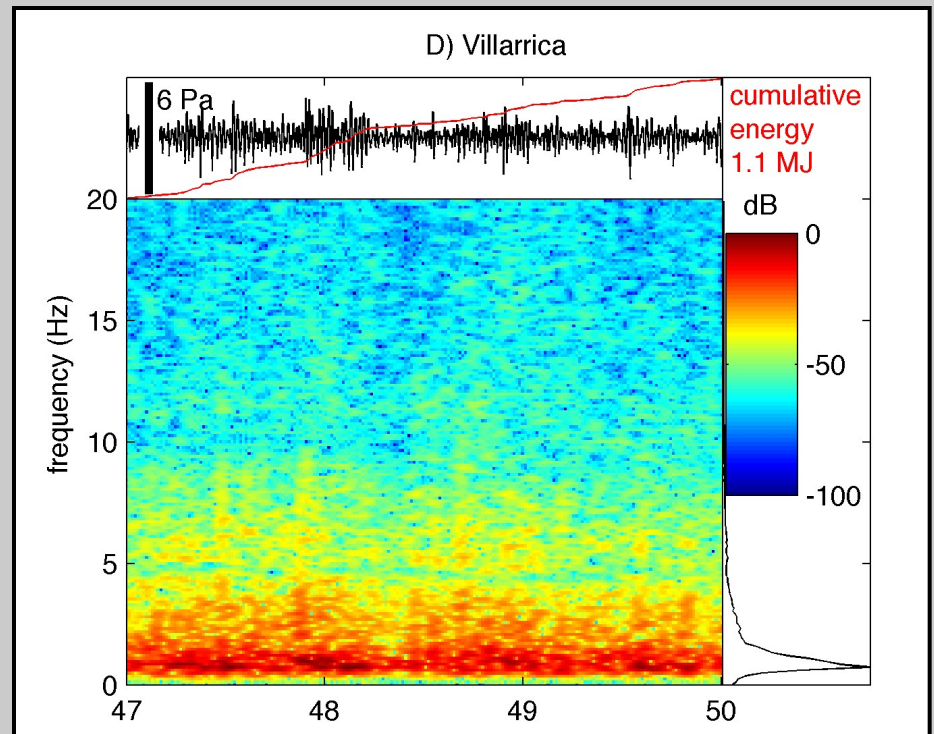

Reventador (Ecuador) - continuous degassing giving rise to ~500-m-high vapor plume. Infrasound is dominated by harmonic tremor ('chugging'), which produces consistent levels of sound and sound power (~**4000 Watts**) until shutting off.

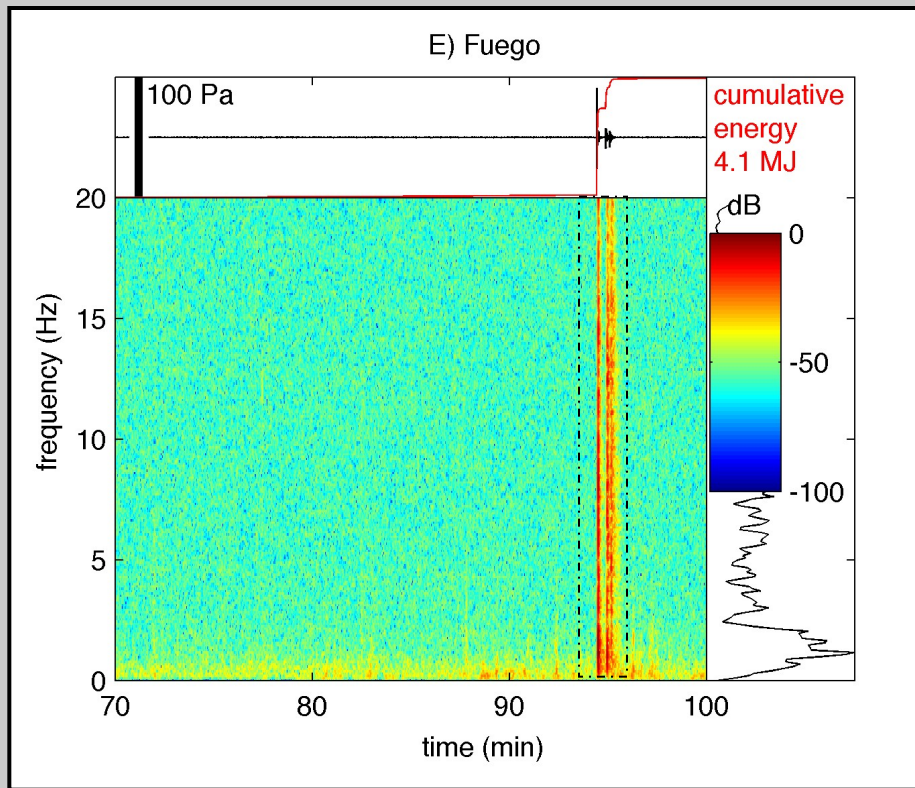

Halemaumau, Kilauea (Hawaii) - striking and long-lived monotonic tremor is continuous for months and associated with open-vent lava lake degassing. Transient infrasound pulses are thought to represent explosions instigated by pit crater collapse during which ash and blocks are expelled several hundred meters. Long term averaged acoustic power is **~300 W**.

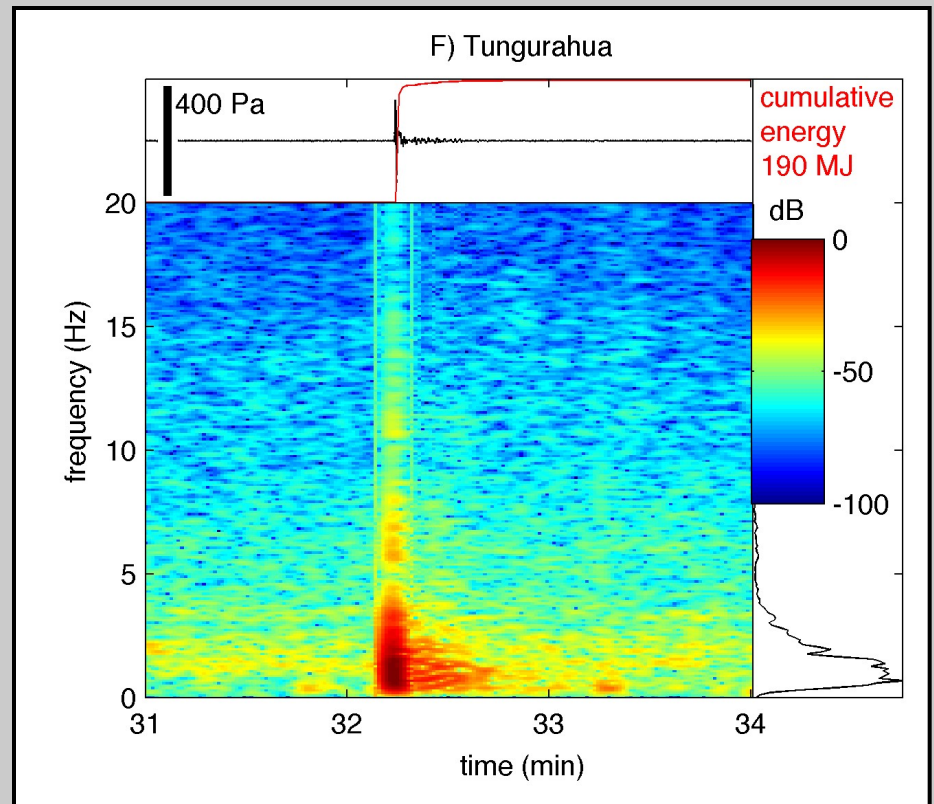

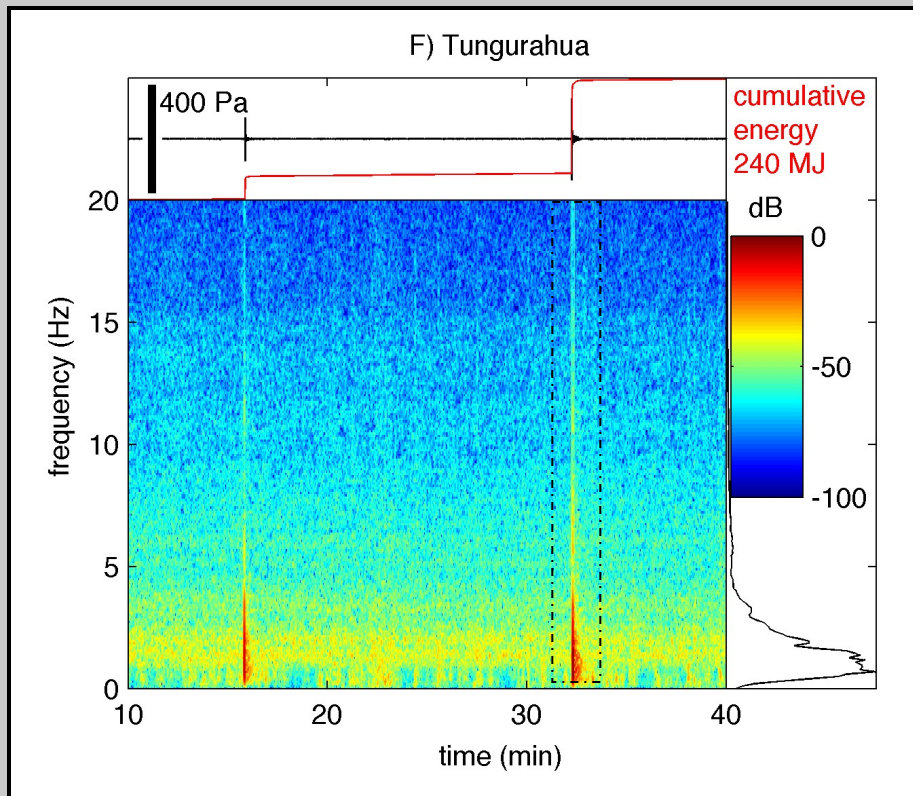

Villarrica (Chile) - like Kilauea, another monotonic tremor system associated with open-vent lava lake activity. Energy is sharply peaked at 0.77 Hz. Small Strombolian explosions at bottom of crater are not associated with infrasound transients. Sustained acoustic power is **~6500 W**.

Fuego (Guatemala) - short-duration Strombolian/Vulcanian explosions generate intense, short-lived infrasound transients, which are relatively broad band in character. Almost all acoustic energy is released during these short events when acoustic power reaches $\sim 100,000$ W. Long-term averaged acoustic power is ~ 2200 W.

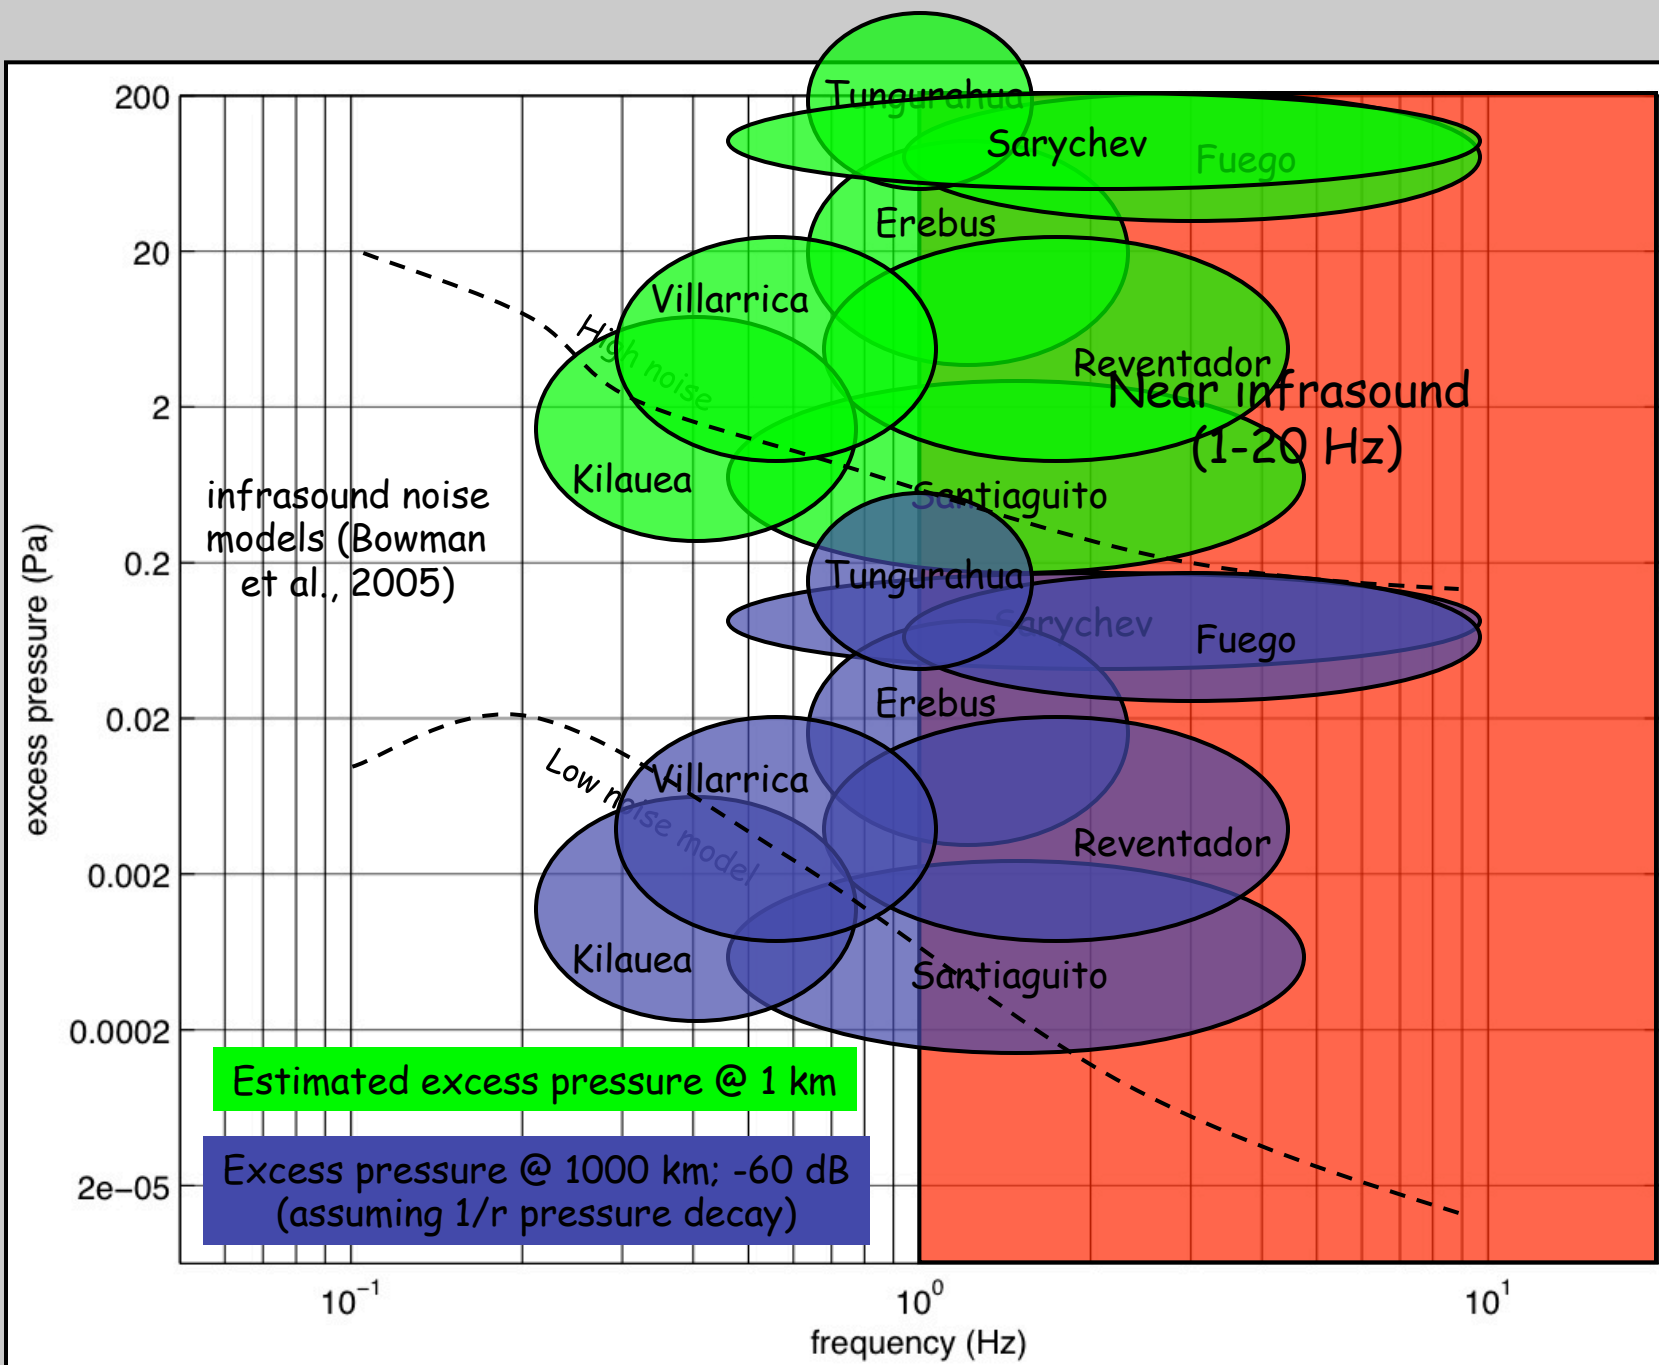

Tungurahua (Ecuador) - short-duration Vulcanian explosions ejecting ballistics to ~2 km generate intense, short-lived infrasound transients, which are confined to frequencies below about 5 Hz. Peak acoustic power is as great as 10 MWatts (10,000,000 Watts) and time-averaged power is more than 100,000 W.

Amplitudes and energies of some volcanic eruptions

	Trace reference start time (yyyy:ddd:hh)	Station distance (km)	max pressure (Pa)	Reduced pressure at 1 km (Pa)	30-minute total energy (MJ) from Figure 1
a) <u>Santiaguito</u>	2009:001:11	0.4	4.4	1.8	0.18
b) <u>Reventador</u>	2005:236:16	1.7	0.9	1.5	6.8
c) Kilauea	2008:190:09	2.4	1.3	3.2	0.59
d) <u>Villarrica</u>	2010:22:12	0.1	58	2.9	12
e) Fuego	2007:117:13	7.0	5.9	41	4.1
f) Tungurahua	2009:165:15	5.5	27	150	240

Sound Pressure Level and (Infra)sounds
